

ICD PROPERTY/ HWKR FOOD CENTRE

ICD Property is a Melbourne-based property developer with a passion for creating world-leading projects which enhance the local environment. One such project is the exciting new HWKR Food Centre in Melbourne's CBD. Inspired by the bustling mix of people and flavours found at hawker food centres in Singapore and Malaysia, this will provide a contemporary space which allows people to socialise and discover a rotating selection of South East Asian cuisine in the heart of Melbourne.

In order to deliver this vision, ICD Property required a comprehensive and integrated IT solution to provide a firewall and internet security, all networking infrastructure, plus public and private wireless networks. Beyond design, supply and installation, ICD also required ongoing monitoring, support and management for the finished solution.

MSP Blueshift were able to utilise connections with our industry partners to design a completely meshed wireless solution secured by a Sophos firewall and carried on the Datto managed switching infrastructure. The system provides a private wireless access network and public wireless internet access capable of supporting 200 concurrent connections, both password protected.

In addition to providing the required hardware infrastructure and the technical skill required for the installation, MSP Blueshift's Networking as a Service (NaaS) offering completed the comprehensive solution. The ongoing relationship includes warranty-based replacement of any equipment as well as 24/7 monitoring, support and maintenance. The service is based on a single fixed monthly fee, which saved the client from making a large initial capital investment.

MSP Blueshift's comprehensive IT solution offered complete peace of mind by delivering a system that met the client's requirements along with a long-term commitment to excellent service, providing ongoing maintenance and support over the life of all the equipment.

HIGHLIGHTS

- **Utilisation of connections with industry partners to design a completely meshed wireless solution.**
- **A private wireless access network and public wireless internet access capable of supporting 200 concurrent connections.**
